

Population – Historical Demographic Change

Clarence

The chart indicates that over the past 10 years the key working age cohorts of between 15 to 49 years have seen steady growth in Clarence.

The most significant growth was evident in the 65 to 79 year cohort, but in general all cohorts over 50 years saw higher growth than the younger age cohorts, therefore resulting in the ageing of the Clarence population.

Glenorchy

Over the past 10 years Glenorchy has seen steady growth in all cohorts, except the 80+ year cohort where growth was flat.

The most significant growth was evident in the 50 to 79 year cohorts.

Notably population growth in the age groups over 50 years was offset by similar growth in the younger age groups, thus maintaining Glenorchy's younger age profile.

Hobart

The chart indicates that over the past 10 years the 0 to 14 year cohort in Hobart saw the strongest growth across the four councils, while the 15 to 49 year cohort saw steady growth.

The 50 to 64 year cohort did not increase appreciably in size over the decade, while the 65 to 79 year group saw the strongest growth over the decade.

Kingborough

Over the past 10 years Kingborough has seen growth in all cohorts, but the growth in the population above 50 years old is well over twice the growth in the younger population.

The 65 to 79 year group saw the strongest growth over the decade, while the other

Greater Hobart

Overall, over the past 10 years, all cohorts saw growth, but the most significant increase was in the older age groups.

The most significant growth was evident in the 65 to 79 year cohort, followed by the 50 to 64 year cohort.

In the last decade, the proportion of the population below the age of 50 has declined from 65% in 2009 to 62% in 2019, with a corresponding increase in the proportion of the over 50 year old population.
